TIBCO EBX® Insight Add-on (New) Release Notes

Version 6.2.0
June 2024

Table of contents

New features

This release contains the following new features:

- A new permission option is available that takes into account any custom record level access rules. The record level permissions are set in the DMA. Take the example where a record level permission allows a user profile to only view active customers. If the table has 1000 customers and 300 were inactive, the indicator results for the user profile would only be based on the 700 active customers. When record level permissions are applied, the indicator results cannot be shared with other users when this permission setting is applied.

- Built-in workflow functions now support the legacy workflow mode.

- The add-on now has the option to apply a restriction policy when specifying user permissions.

- The queuing of scheduled indicator executions was improved.

- The permissions for the data profiling service were updated to follow the **Bypass EBX permission**, when this option is enabled.

Changes in Functionality

This release contains no changes in functionality.

Changes to third-party libraries

This release contains no changes to third-party libraries.

Closed Issues

- **[DPRA-2599]** Staging archives cannot be imported when the default encoding is not UTF-8.

- **[DPRA-2589]** Indicator executions do not apply rounding for the averaged results.

Known Issues

This release contains the following known issues:

- **[DPRA-2613]** Executing the T03 indicator function can cause other indicators configured on computed values to fail when the indicators are executed at the same time.

- The following data types are not currently available for indicators to monitor:
  - multi-value foreign keys
  - associations
  - multi-value groups

- Validation of configuration data after importing it from an archive file is not supported.
