Stepwise Model Builder Overview

The Stepwise Model Builder computes the marginal predictor statistics given a current model.

Specifically, the variables listed in the Marginal results table are entered one at a time into a logistic regression model containing the predictors listed in the Model results table. This enables the analyst to evaluate the unique contribution of each predictor candidate not in the equation. The model is estimated after recoding all Bad code values to 1 and Good code values to 0.

Notation

The following notation is used throughout this model section of this document:

Notation	Description
n	Number of observed cases
р	Number of parameters
у	$n \times 1$ vector with y_i being the observed value of the i th case of the chosen dichotomous good/bad dependent variable
х	$n \times p$ matrix with x_{ij} being the observed value of the i th case of the j th parameter
ß	$p \times 1$ vector with \mathbb{G}_j being the coefficient for the j th parameter
W	$n \times 1$ vector with w_i being the weight for the i th case.
l	Likelihood function
L	Log likelihood function
I	Information matrix

Model

The Stepwise Model Builder uses the linear logistic model.

This model has a dichotomous dependent variable, and in this module the outcome is labeled as either having a Good or Bad outcome. Included in the Stepwise Model Builder dialog box are options for Dependent Variable (Y), Good code and Bad code. For the model, the dependent variable is assumed to have a probability π , where for the *i*th case:

$$\pi_{i} = \frac{exp(\eta_{i})}{1 + exp(\eta_{i})}$$
or
$$ln\left(\frac{\pi_{i}}{1 - \pi_{i}}\right) = \eta_{i} = X_{i}'\beta$$

For *n* observations, y_1 through y_n , with probabilities π_i through π_n and case weights w_1 through w_n, the likelihood function is:

$$l = \prod_{i=1}^{n} \pi_{i}^{w_{i}y_{i}} (1 - \pi_{i})^{w_{i}(1 - y_{i})}$$

The logarithm of *l* is:

$$L = \ln(l) = \sum_{i=1}^{n} (w_i y_i \ln(\pi_i) + w_i (1 - y_i) \ln(1 - \pi_i))$$

The derivative of L with respect to \mathcal{B}_i is:

$$L_{X_j}^* = \frac{\partial L}{\partial \beta_j} = \sum_{i=1}^n \mathbf{w}_i (y_i - \pi_i) x_{ij}$$

Estimation

Maximum Likelihood Estimation is achieved through the Fisher Scoring algorithm.

$$\beta_{k+1} = \beta_k + I^{-1}S$$

$$Ipxp = -E_{\beta} \left[\frac{\partial^2 l(\beta)}{\partial \beta^2} \right]$$

$$S = \frac{\partial l(\beta)}{\partial \beta}$$

Statistics

Estimated Variance Covariance Matrix

The estimated covariance matrix is the inverse of the information matrix (negative of the expected Hessian) evaluated at the MLE values of the parameters.

$$I(\theta_{MLE})^{-1}$$

$$I(\theta_{MLE}) = -E_{\theta}[H(\theta)]$$

$$H(\theta) = \frac{\partial^{2}l(\theta)}{\partial\theta^{2}}$$

Estimated Correlation Matrix

The estimated correlation matrix is the standardized version of the covariance matrix, that is, all entries are divided by the product of the standard deviations.

Gini Coefficient

$$G = 2\left(\frac{Number\ of\ Bads}{N}\right)\left(\frac{Number\ of\ Goods}{N}\right)$$

Notation:

N = Total number of observations

Hosmer-Lemeshow (HL) Goodness of Fit Statistic

$$H = \sum_{g=1}^{n} \frac{(O_g - E_g)^2}{N_g \pi_g (1 - \pi_g)}$$

Notation: O_g = Observed event g

 E_g = Expected event g

 N_g = Observations of event g

 π_q = Predicted risk for the g^{th} risk decile group

n = number of groups

Note: The Hosmer-Lemeshow statistic is asymptotically distributed and follows a X^2 distribution with n-2 degrees of freedom.

Kolmogorov-Smirnov (KS) test

For all Good observations, predicted probability of Bad is computed, that is the relative frequency of bad cases in the bin a Good observation is placed. This process is repeated for all Bad observations. The KS test is then completed with the Good/Bad indicator as the group variable and the predicted probability of Bad as the response.

$$Z = max_j^{|D_j|} \sqrt{\frac{n_1 n_2}{n_1 + n_2}} j$$

Significance level (p) approximation is based on the formula:

$$p = 2\sum_{i=1}^{\infty} (-1)^{i-1} e^{-2i^2 \left(KS\sqrt{\frac{n_1}{n_1 + n_2} + 0.12 + 0.11} / \sqrt{\frac{n_1}{n_1 + n_2}}\right)^2}$$

Lift Value

$$Lift = \frac{Result\ Predicted\ by\ Model}{Result\ Predicted\ with\ No\ Model}$$

ROC - Area Under Curve (AUC)

$$AUC = \frac{G+1}{2}$$

Notation: G = Gini coefficient

ROC - Sensitivity

Sensitivity = $\frac{number\ of\ true\ positives}{\frac{number\ of\ true\ positives\ begin{subarray}{c} number\ of\ followed a setting begin{subarray}{c} number\ of\ true\ positives\ begin{subarray}{c} number\ of\ true\ positives$

number of true positives + number of false negatives

Note: If a test has two outcomes, positive and negative:

- o True Positive

 Both the observed and predicted response is positive.
- False Positive Predicted response is positive but the observed response is negative.
- True Negative
 Both the observed and predicted response is negative.
- False Negative
 Predicted response is negative but the observed response is positive.

ROC - Specificity

 $Specificity = \frac{number\ of\ true\ negatives}{number\ of\ true\ negatives + number\ of\ false\ positives}$

Somers' D

If ties are present:

$$d=\frac{(n_c-n_d)}{t}$$

If ties are not present:

$$d=2~c~-1$$
 where $c=\left.\left(n_c+0.5(t-n_c-n_d)\right)\right/_t$

Wald Statistic

For continuous variables:

$$W_i = \left(\frac{\beta_i}{SE_{\beta_i}}\right)^2$$

For categorical variables:

If β_i is a vector of MLEs associated with m-1 dummy coded variables, and \mathbf{C} is the asymptotic covariance matrix for β_i , the Wald statistic is calculated as:

$$W_i = \beta'_i C^{-1} \beta_i$$

Note: Asymptotically distributed as a X² distribution with degrees of freedom equal to the number of parameters estimated and is analogous to the t-test in linear regression.

Wald Statistic - Standard Error

The standard error (SE) is the square root of the ith diagonal entry of the inverse information matrix.

Wald Statistic Confidence Interval

100 $(1 - \alpha)\%$ CI for $\beta_i = \hat{\beta}_i \pm z_{1-\alpha/2}SE_{\beta_i}$

Notation: $z_{1-lpha/2}$ = 100~(1-lpha/2)th percentile of the standard normal distribution

 $\hat{\beta}_i$ = Estimate of parameter β_i

 SE_{eta_i} = Standard error estimate of \hat{eta}_i

TIBCO Documentation and Support Services

For information about this product, you can read the documentation, contact TIBCO Support, and join TIBCO Community.

How to Access TIBCO Documentation

Documentation for TIBCO products is available on the TIBCO Product Documentation website, mainly in HTML and PDF formats.

The TIBCO Product Documentation website is updated frequently and is more current than any other documentation included with the product.

Product-Specific Documentation

The following documentation for this product is available on TIBCO Statistica® Product Documentation page and TIBCO Statistica®- All Servers Product Documentation page:

- TIBCO Statistica® Release Notes
- TIBCO Statistica® Installation
- TIBCO Statistica® Quick Reference
- TIBCO Statistica® Product Traceability
- TIBCO Statistica® Configuration for Windows Server 2019
- TIBCO Statistica® Data Entry Administration
- TIBCO Statistica® Server Administrator's Guide
- TIBCO Statistica® Options Configuration
- TIBCO Statistica® R Integration: Features and Options
- TIBCO Statistica® Security Guide
- TIBCO Statistica® User Guide
- TIBCO Statistica® Enterprise Manager Guide
- TIBCO Statistica® Statistica Object Model Guide

- TIBCO Statistica® Logistic Regression Formula Guide
- TIBCO Statistica® Stability Analysis Formula Guide
- TIBCO Statistica® Stepwise Model Builder Formula Guide
- TIBCO Statistica® Weight of Evidence Formula Guide

The following documentation for this product is available on TIBCO® Data Science for TIBCO Spotfire® Analyst Product Documentation page:

- TIBCO® Data Science for TIBCO Spotfire® Analyst Release Notes
- TIBCO® Data Science for TIBCO Spotfire® Analyst User Guide

The following documentation for this product is available on TIBCO® Data Science Service for TIBCO Spotfire® Product Documentation page:

- TIBCO® Data Science Service for TIBCO Spotfire® Release Notes
- TIBCO® Data Science Service for TIBCO Spotfire® User Guide

How to Contact TIBCO Support

Get an overview of TIBCO Support. You can contact TIBCO Support in the following ways:

- For accessing the Support Knowledge Base and getting personalized content about products you are interested in, visit the TIBCO Support website.
- For creating a Support case, you must have a valid maintenance or support contract
 with TIBCO. You also need a user name and password to log in to TIBCO Support
 website. If you do not have a user name, you can request one by clicking Register on
 the website.

How to Join TIBCO Community

TIBCO Community is the official channel for TIBCO customers, partners, and employee subject matter experts to share and access their collective experience. TIBCO Community offers access to Q&A forums, product wikis, and best practices. It also offers access to extensions, adapters, solution accelerators, and tools that extend and enable customers to gain full value from TIBCO products. In addition, users can submit and vote on feature requests from within the TIBCO Ideas Portal. For a free registration, go to TIBCO Community.
